

# net.shrine.status.InvalidVerifySignatureResponse

## Summary

The client for handling certificate diagnostic across Dashboards in the Status Service received an invalid response.

## Explanation

The local Dashboard received an invalid response while trying to contact a downstream dashboard while trying to verify your signature. You will not be able to communicate with this downstream node via the Dashboard, and will likely have other signature-related problems with it.

## Resolution

The hub admin and downstream node admin must work together to examine their keystores and discover why the local dashboard's signature is not recognized.
