

net.shrine.metadata. NotOkStatusCodeWhileRequestingQueuedResults

Summary

The SHRINE hub responded with something other than an OK http status when the QEP service requested an update on a QUEUED query result.

Since 1.24

Explanation

The requested query earlier entered at least one CRC's queue, and was reported in a QUEUED state. The QEP was unable to request an update because of a problem detected when it contacted the hub. The problem most likely involves a problem at the hub.

Resolution

If you are a user contact your local admin.

If you are the QEP admin, share all of the details about the problem with the SHRINE network administer.
